2. Citations and explanations (Rule 70.7)			
<p>The invention relates to a meter register for a fluid dispenser, in which the engagement of two components is used to transform the translation of an actuator into a rotation of a register.</p>			
<p>Such a register is described in DE 100 61 723 (D1), wherein figures 6 and 7 show components 26 and 27, which engage to transform a translation into a rotation used to advance the register.</p>			
<p>A problem that arises with the register described in D1 is that the register does not advance in rotation unless translation occurs over the entire stroke. There is therefore a risk that a partial translation may not be counted although an amount of the fluid has been delivered.</p>			
<p>The invention solves this problem by integrating an actuator and actuating means into the register, such that one of the two latter components comprises an oblique portion for engaging with the other and transforming translation into rotation; and further comprises a rectilinear portion enabling translation to occur without</p>

effecting the rotation of the other. Said components therefore engage to transform translation into rotation at the start of the stroke of said translation, and the risk of an amount being dispensed without being counted is thus avoided.

These features are neither described nor suggested by the available prior art.

It should be noted that, in the prior art and moreover in the field of meters in general, there are means for rendering a translational motion inoperative. Integrating means of this kind in a meter as defined in the preamble of claim 1 would make it far more complex and difficult to assemble.

Independent claim 1 therefore meets the PCT requirements of novelty, inventive step and industrial applicability.

Consequently, dependent claims 2 to 21, which contain all the technical features of claim 1, also meet the PCT requirements of novelty, inventive step and industrial applicability.
